Preface

The Swedish Cancer Registry was established in 1958. In this publication the Centre for Epidemiology (EpC) at the National Board of Health and Welfare presents its 50th annual report on the incidence of cancer in Sweden. It comprises the material for 2007 and a description of trends covering the period of 1960-2007.

In the present report the rates are age standardized according to the population January 1, 2000. A comparison between different age standardizations are shown in Figure A. The cumulative probability to develop cancer is presented on page 25. Trends in cancer incidence are presented on page 31.

Site and histopathology ("morphology") of the tumors has been coded in the ICD-O/3 systems of topography and morphology as of January 1st 2005. In the present publication, ICD-O/3 figures for coding site have been translated to comply with earlier ICD-7 praxis, and are presented in the main tables according to ICD-7. Table W1 show that, for all practical purposes, such a translation is feasible.

Sammanfattning

Under 2007 har 50 100 maligna cancerfall diagnosticerats och rapporterats till cancerregistret i Sverige. Könsfördelningen är relativt jämn: 52 % av fallen är bland män och 48 % bland kvinnor. Antalet cancerfall har ökat under de två senaste decennierna med en genomsnittlig årlig ökning på 1,7 % för män och 1,1 % för kvinnor. Ökningen förklaras till viss del av förändring i befolkningens åldersstruktur men även av screening och förbättrade diagnostiska metoder.

Bröstcancer är den vanligaste cancerformen hos kvinnor och utgör 29 % av de diagnostiserade fallen. Den genomsnittliga årliga ökningstakten för bröstcancer var 1,2 % under de senaste tjugo åren. Den vanligaste tumörformen bland män är prostatacancer som svarar för 34 % av fallen under 2007. Incidensen av prostatacancer har i genomsnitt ökat med 2,8 % per år sett över en period på 20 år men under de senaste två åren minskar dock incidensen. Om det är början på en långsiktig nedgång är dock oklart.

Maligt melanom och övrig hudcancer (utom basalcellscancer) utgör sammantaget 13 % av cancerfallen. Övrig hudcancer är nästan dubbelt så vanligt som maligt melanom och är den näst vanligaste cancerformen bland män och den tredje vanligaste bland kvinnor. Förekomsten av både maligt melanom och övrig hudcancer ökar i Sverige och den genomsnittliga årliga ökningstakten är högre för kvinnor än för män.

Tjocktarmscancer är den näst vanligaste cancerformen hos kvinnor och den tredje vanligaste hos män. Sammantaget utgör den 8 % av fallen som rapporterats till cancerregistret för 2007 och data från de senaste 10 åren visar en svagt ökande trend beträffande förekomst av tjocktarmscancer bland kvinnor men ingen förändring bland män.

Sannolikheten för en man att diagnostiseras med cancer före 75 års ålder är knappt 30 % och motsvarande sannolikhet för kvinnor är knappt 27 %.

Summary

During 2007 there were 50 100 cases of cancers diagnosed and reported to the Swedish cancer registry; 52% of them in men and 48% in women. During the last two decades the average annual increase has been 1.7% for men and 1.1% for women. The increase is partly explained by the ageing population but also by the introduction of screening activities and improvements in diagnostic practices.

Breast cancer is the most common cancer in women representing 29% of the cases in 2007 and the average annual increase was 1.2% during the last two decades. Prostate cancer is the most common cancer in men, representing 34% of the male cases in 2007. On average, the incidence has increased by 2.8% annually seen over the last 20 years but has decreased during the last two years. It is uncertain whether this is the start of a continuing decreasing trend.

Malignant melanoma and other skin cancer (except basal cell carcinoma) represent 13% of the cancer cases. Skin cancer is more common than malignant melanoma and is the second and third most common cancer in men and women. The incidence trend is increasing for both sexes and is higher in women than in men.

Colon cancer is the second most common cancer in women, and the third in men, corresponding to 8.0% of the total number of cases. Data from the last 10 years show a weak increasing trend among women but no change among men.

The probability of developing cancer before the age of 75 is 30% among men and 27% among women.

Material

According to Regulations by the National Board of Health and Welfare (SOSFS 2006:15) all physicians in hospitals and other establishments for medical treatment under public or private administration in Sweden must report all cases of cancer ("Clinical report", Appendix 3) to the Cancer Register. Furthermore, pathologists and cytologists separately report every cancer diagnosis on surgically removed tissues, biopsies, cytological specimens, bone marrow aspirates and autopsies. Thus, the majority of cases are notified twice, in separate reports. Only persons that have official residency in Sweden are included in the Cancer Register.

The registration of new cancer reports and the major check-up and correction work is performed by six regional cancer registers covering the whole country. These registers are associated with the oncological centre in each medical region of Sweden (Stockholm-Gotland, Uppsala-Örebro, Linköping, Lund-Malmö, Göteborg and Umeå). The regionalization implies a close contact between the register and the reporting physician which in turn alleviates the task of correcting and checking the material. Annually the regional registers send information of newly registered cases and corrections concerning those previously reported to the National Cancer Register.

The present publication comprises statistics on cases of cancer diagnosed in 2007.

The following diseases are to be reported to the National Cancer Register.

- A All definitely malignant neoplasms (e.g. carcinoma, sarcoma, malignant lymphoma, leukemia and malignant teratoma).
- B Carcinoid tumors of digestive and other organs, granulosa cell tumors of the ovary, thymomas, adamantinomas and chordomas.
- C Histologically benign tumors of the central nervous system and meninges, transitional cell papillomas of the urinary tract, all hormonally active tumors of the endocrine glands (except the thyroid) and the entero-chromaffin and neuroendocrine systems.
- D Precancerous lesions of lip, mouth, larynx, bronchus, trachea, cervix uteri, skin, vulva and vagina, gastro-intestinal polyps with suspected malignancy, "bronchial adenomas", atypical epithelial proliferations of the breast (carcinoma in situ type) and adenoma phyllodes, precancerous endometrial lesions, hydatidiform moles of placental tissue, and ovarian cystadenomas of borderline type.

Diseases mentioned under A - C are included in the total cancer incidence (Tables F, G, I, J and 1-10), although a number of the tumors listed under C are considered not to be "infiltrating and metastasizing" (Table G).

The benign tumors and precancerous lesions mentioned under D are listed in Table H.

If a person has more than one primary tumor, each tumor is registered separately. This also applies for tumors appearing in the same parenchymal organ, provided the neoplastic tissues and histogenetic properties differ among the tumors (for instance, if one neoplasm is a carcinoma and another a sarcoma). Each new primary tumor in the skin, intestine and urinary tract is registered.

Information from death certificates is available to the Register, supplying date and cause of death. Death certificates until December 31, 2006 have been merged with the files of the Cancer Register 1958-2006. Due to the fact that the Cause of Death Register has not been updated to 2007, 2006 is the last year available. Cancer diagnoses based on death certificates are not registered.

The persons in the Cancer Register have also been followed up regarding to migration through Statistics Sweden.

Information available in the Cancer Register

Data in cancer reports

- Unique personal identification number composed of 8 digits based on century, year, month and day of birth, supplemented with the so-called registration number (3 digits) and a check digit
- Sex
- Domicile (county, municipality, parish)
- Hospital
- Hospital department
- Pathology/cytology department
- Specimen number, and year when specimen was taken
- Site of tumor. The basic coding has been performed according to:
 - ICD-7 1958-1986 (WHO/HS/CANC/24.1)
 - ICD-9 1987-1992 (WHO 9th revision 1976)
 - ICD-O/2 1993-2004 (2nd Edition WHO Geneva 1990)
 - ICD-O/3 2005-w (International Classification of Diseases for Oncology. 3rd Edition. WHO Geneva 2000)The different classifications are translated to ICD-7 to enable longer trends. For exceptions cf. Appendix 1.
- Tumor serial number
- Malignancy (yes/no)
- Histological type (WHO/HS/CANC/24.1 Histology Code). From 1993 according to ICD-O/2 and from 2005 according to ICD-O/3 (International Classification of Diseases for Oncology. Third Edition. WHO Geneva 2000)
- Stage according to TNM ((TNM Classification of Malignant Tumours, 6th Edition, 2002, Leslie H. Sobin and Ch. Wittekind)
- Stage according to FIGO (<http://www.figo.org>)
- Basis of diagnosis:
 - 1 Clinical diagnosis only
 - 2 X-ray
 - 3 Histological examination of surgical or biopsy material (patho-anatomic diagnosis, "PAD")
 - 4 Autopsy with histopathological examination of surgical or biopsy material
 - 5 Cytological diagnosis

- 6 Gross examination at surgery
- 7 Autopsy without histopathological examination
- 8 Other
- Date of diagnosis (century, year, month, day)
- Diagnosis made incidentally at autopsy (yes/no)

Data from the Cause of Death Register

- Date of death (century, year, month, day)
- Cause of death. Main underlying cause, according to:
ICD-7 1958-1968, ICD-8 1969-1986,
ICD-9 1987-1996, ICD-10 1997-w

Reporting procedures and controls of the material

The reports are registered continuously at the regional cancer registers. Usually a notification from the pathology/cytology lab arrives first, followed by a clinical notification. Whenever reports arrive separately, they are registered with a flag to show that one report is lacking. If the missing report does not arrive within three months, a reminder is sent out. In 30-40 per cent of the cases, reports have to be traced according to this scheme. If the missing report does not arrive, the required information can be taken from the hospital case record, if available. If this source of information is also lacking, registration is done on the basis of the information that is available at hand. The percentage of cases with such an incomplete registration is less than two per cent.

A small number of cases (annually some hundred) are reported too late to be included in the publication. These cases are added to the register whenever they arrive.

An estimation of the under reporting of cancers can be done by comparing the Cancer Register data with the Cause of Death Register (see next chapter).

The material passes through the following controls:

- the identification number is checked against the register covering the total population of Sweden
- duplicates are subject to special checking
- the validity and logical contents of the codes are checked when the material is processed.

Validity of the data

Approximately 99 per cent of the cases are morphologically verified (Table 8). The reliability of the diagnosis may vary with the hospital, department and/or physician concerned; this may add to a geographical variability, though the structure of the public health system is homogeneous. The availability of facilities for pathology service likewise varies. The reliability of the diagnosis also varies with age and type of disease.

The figures on incidence from the Cancer Register include data on cases of cancer found incidentally at autopsy. The contribution from this additional source varies with site and type of tumor. Variations in the incidence of a particular type of tumor in a certain geographical region may partly be due to differences in frequency and thoroughness of the autopsy examination and the histologic examination of the autopsy specimens. Cancer of bronchus/lung, pancreas, colon, liver and prostate are often overlooked at clinical examinations but are found incidentally at autopsy. Table 3B gives the number of all cases found incidentally at autopsy by site, sex and medical region.

The Swedish Cancer Register does not use information on cancers based on death certificates, the reason being that the data on the death certificates in many instances are uncertain - especially regarding old persons - as shown in a separate analysis (1).

In 2006, there were 2 761 persons in the Cause of Death Register with cancer stated as underlying cause of death which were not on file in the Cancer Register 1958-2006. The most common cancer sites were - as noted previously - bronchus/lung, pancreas and prostate. The distribution by sex, age, and autopsy is shown in Table A1 and Table A2. The figures show that most of the cases are 75 years of age, or older, and not autopsied.

Due to the fact that the Cause of Death Register has not been updated to 2007, 2006 is the last year available.

Statistical terms

Age

The age of the patient at the date of diagnosis.

Crude incidence rate

The total number of cases divided by the corresponding mean population per 100 000. Rates for males and females are calculated separately.

Age specific incidence rate

Number of cases for each five year age-group divided by the corresponding mean population per 100 000. Rates for males and females are calculated separately.

Age standardized incidence rate

In Tables E, J and 4-6, the figures have been adjusted for age distribution to the Swedish population January 1, 2000. In order to facilitate international comparisons, the incidence rates have also been adjusted to the world standard population (Tables E, 4 and 7). In the latter table the sites 204-209 (leukemia, polycythæmia vera and myelofibrosis) are aggregated. The standard populations and more details on definitions of statistical terms are given in Appendix 2.

Cumulative probability of developing cancer

In Table I the cumulative probability to develop a cancer before a certain age has been estimated from the age specific incidence rates in Table 4.

Trend

The trends over time are calculated from the age adjusted figures on tumor rates in 18 different age groups. In Table J the trend figures for both the last 10 and 20 years are presented. The time series of age standardized rates plotted in Figures F1-F28 cover the period from 1960 to 2007.

Comparisons between trends covering different time periods should be made with caution since diagnostic methods may vary, and coding practices change. Furthermore, in the trend periods shown in the present publication, the age structure of the population, the autopsy frequency (recent figure 14 per cent, compared to 50 per cent in the seventies), and type and forms of screening activities vary.

The population of Sweden

The life expectancy at birth in Sweden for 2007 was 78.9 years for males and 83.0 for females. Some demographic data for the population are given in Tables B - D.

Table B: Selected population data for Sweden 2007, by sex

	Males	Females	Total
Mean population	4 543 722	4 604 370	9 148 092

Total cancer incidence 2007

The incidence is based on a total of 50 100 cancers reported to the Swedish Cancer Register in 2007, 455 cases of them were found incidentally at autopsy.

The number of persons with cancer diagnosed for the first time in 2007 was 41 427 (21 628 males and 19 799 females); thus 8 673 cancers were diagnosed in persons with at least one previous cancer diagnosis. During 2007, 48 401 unique persons were diagnosed with cancer. The distribution of all reported cancers is given by sex in Table E below.

Cancer Incidence in Sweden 2007

Table E: Total numbers and total rates per 100 000, by sex

	Sex	New cases	Rates per 100 000		
			Crude rate	Sweden*	World**
All tumors	M	25 939	570.9	605.1	293.9

Cancer Incidence in Sweden 2007

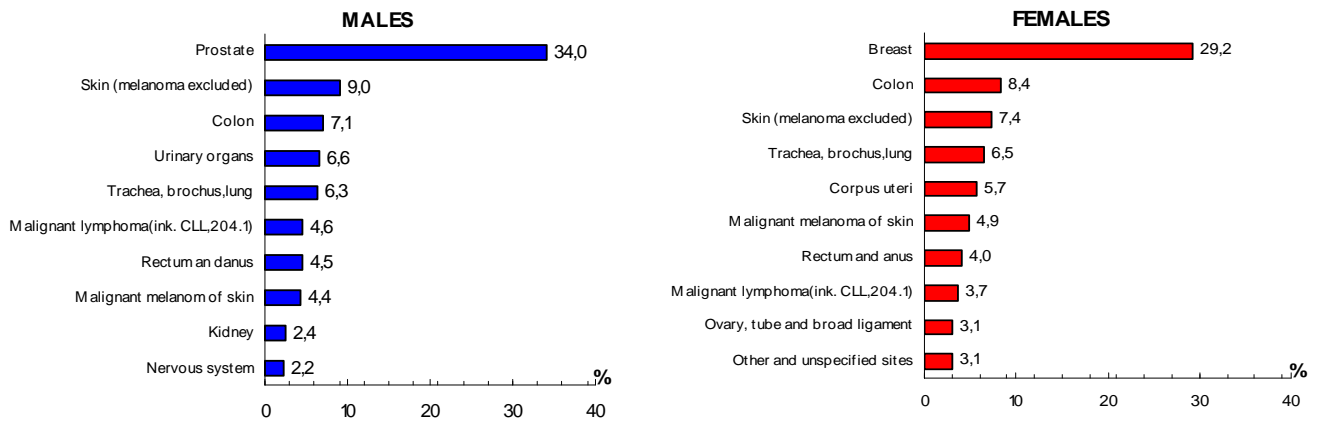

Figure A: Comparison between different methods of calculating incidence rates per 100 000, by sex

The percentage distribution of the ten most frequent forms of cancer is given in Figure B below. The cases cover 81.1 per cent of all male cancer. The corresponding figure for females is 76.0 per cent.

Cancer Incidence in Sweden 2007

Figure B: The ten most frequent specified cancer sites, by sex

The age-specific incidence rates for all cancer are shown in Figure C. The graph illustrates that cancer mainly is a disease of the older age groups. In the age groups from 25-29 to 55-59 years, the incidence is higher among females, mostly because of the dominance of breast and genital cancer.

Cancer Incidence in Sweden 2007

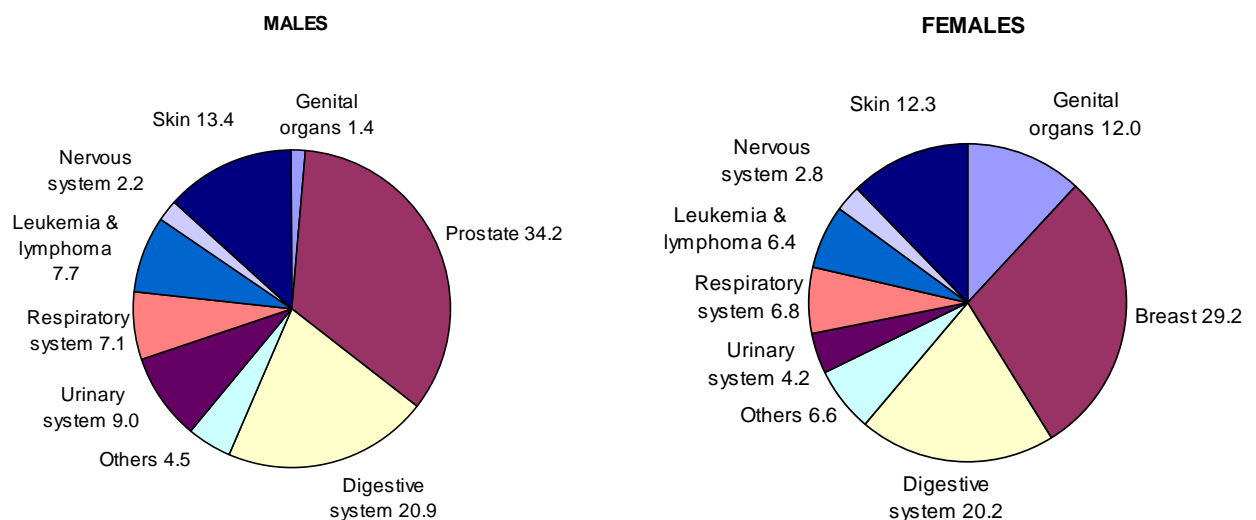

Figure C: Age-specific incidence rates per 100 000. All sites, by sex

In Figure D, closely related cancer sites have been grouped and presented by sex. The distribution by individual site and sex, is shown in Table F.

Ovarian cystadenoma with borderline malignancy	0	241	241
Preleukemia	116	106	222

Cumulative probability of developing cancer

The risk of developing cancer varies strongly with age and by site.

Table I shows the probability to develop a specific cancer up to a certain age for selected sites. Only sites with a life-time probability (up to age 75) of approximately one per cent are presented in the table.

Note: The probability has been estimated from the age specific rates in Table 4.

Trends in cancer incidence

Factors that affect trends include changes in coding practices, age structure of the population at risk, and the autopsy frequency, as well as the introduction of screening activities and improvements in diagnostic practices. For this reason, conclusions may be difficult to draw from trend figures covering long time periods. In the presentation of the trends, we present figures both for a 20-year period and the latest decade (Table J).

The annual number of cancer cases in Sweden has increased during the last two decades. The average annual increase is 1.7 per cent for men and 1.1 for women. About half of this increase is explained by the continuous ageing of the population. This is seen in the graphs in Figure A where the crude rates are compared with age standardized rates. During recent years the trend regarding number of cases is turning among males. This is largely explained by a decrease in number of prostate cancer cases (Figure E).

The average annual changes in time trends are calculated according to an exponential model (the end of Appendix 2) with the age standardized incidence rates as point estimates.

The average annual increase in the age standardized rates for all cancer is 0.8 per cent for men and 0.5 per cent for women during the last 20 years. The corresponding figure for the period 1998-2007 is 0.9 for males and 0.7 for females.

Comments about trends in age standardized incidence in selected sites:

- **Lip cancer.** The incidence of lip cancer in males is continuously decreasing with an estimate of annual decrease of 3.7 per cent since 1988. It is a rare cancer though with an age standardized incidence changing from 3.5 to 2.3 cases per 100 000 persons between 1988 and 2007.
- **Stomach cancer.** There is a remarkable annual decrease in incidence for both men and women during the 20-year period (3.9 per cent for men and 3.6 per cent for women). Corresponding figures for the last 10-year period is 3.4 for men and 2.5 for women. The decreasing trend has been constant since the start of the registry, see figure F4.
- **Cancer of colon and rectum.** Cancer of colon and rectum are among the most common cancer sites in both males and females and the trend is rather stable although colon cancer in women has increased with 1.4 per cent per year on average during the last decade.
- **Liver cancer (primary).** There is an average decrease of 4.1 percent per year in women and 2.2 per cent in men since 1998. In a perspective of 20 years the negative trend is somewhat weaker.

* Implies that the trend is considered to be strictly increasing or decreasing at the 98% confidence level

- **Bronchus and lung, primary.** There is a continuous increase in incidence of lung cancer in women, 3.1 per cent per year for the last 20-year period and 3.6 for the last decade, while the trend in males is decreasing annually with 0.8 per cent during the last 20-year period. Lung cancer is still more common in males than in females though (38 compared to 31 cases per 100 000)
- **Breast cancer in women.** Breast cancer incidence in women has increased with 1.2 per cent annually during the last 20 years but the increase in the recent 10-year period is weaker with an annual change of 0.8 per cent. It is the most common cancer in women.
- **Cancer of female genital organs.** Both cancer of cervix uteri and ovarian cancer are decreasing based on data for the last 20 years (by 1.1 resp 2.0 per cent annually) but during the last decade the trend regarding cervical cancer is rather stable. In 1988 they were equally common but now the incidence of ovarian cancer is approximately 15 cases per 100 000 compared with 10 per 100 000 of cervical cancer. The decrease in incidence of cervical cancer is an effect of screening activities.
- **Cancer of male genital organs (including prostate cancer).** Prostate cancer is the most common cancer in men and the average annual increase is 2.8 per cent over the last 20 years and 2.1 per cent over the last 10 years. The introduction of PSA testing explains the large increase in the late 1990s and early 2000s but the incidence has decrease during the last two years. Testicular cancer increases annually by 3.1 per cent on average in the last 10 years and somewhat lower in a perspective of 20 years but it is still a rare cancer with an incidence of 6.2 per 100 000 persons.
- **Malignant melanoma of skin.** Seen over the last decade, this is one of the most rapidly increasing malignant tumors in Sweden. For men, the average increase per year is 3.6 per cent and for women 3.8 per cent.
- **Non-melanoma skin cancer** (mainly squamous carcinomas). An average annual increase of 3.2 per cent is observed for men and 4.3 for women for the 20-year period. During the latest 10-year period the figures are 3.8 per cent for men and 5.3 per cent for women. This is one of the most common cancer sites in Sweden for both sexes with 60 cases per 100 000 in men and 32 in women.

The incidence rates of cancer in selected sites during the period 1960-2007 are plotted and presented in Figures F1-F28. For many sites, the number of cases are few and random variations play an important role for the configuration of the graphs.

Please note that different scales are used among the figures. The rates are age standardized according to the Swedish population January 1, 2000.

APPENDIX 1

The major exceptions from the codes in the 7th WHO revision (WHO/HS/Canc/24.1. Code for anatomical location).

Site 158 (peritoneum) only includes malignant mesotheliomas of peritoneum, while metastatic lesions are referred to site 199.3.

Site 159 (unspecified digestive organs) has not been used. Such cases are included in site 199.

Site 162.2 (pleura) only includes malignant mesotheliomas.

Site 164 (mediastinum). Thymomas are referred to site 195.2.

Site 172 (corpus uteri) only includes malignant epithelial tumors of the mucosa.

Site 173 only includes malignant chorionic lesions (invasive mole and choriocarcinoma).

Site 174 (uterus, unspecified) includes carcinomas growing in both corpus and cervix uteri (or carcinoma uteri NOS), and uterine sarcomas.

Site 180.1 and 181 include papillomas of the urinary tract.

Site 191. Basaliomas are excluded.

Site 193.0 and .1 include histologically benign tumors of the central nervous system and meninges.

Site 193.3 includes malignant tumors of peripheral nerves and the sympathetic nervous system, irrespective of possible organ connection.

Site 195 (other endocrine glands) includes all benign and malignant tumors, though adrenocortical adenomas have been included only if they have given endocrinological symptoms.

Site 197 includes soft tissue sarcomas without organ connection, and also retroperitoneal tumors (197.4).

Site 198 (lymph nodes) has not been used. Metastatic tumors have been referred to site 199.

Site groups 204-207 (leukemia) are coded according to ICD-8.

Definitions of statistical terms

Age is defined as the date of diagnosis (year, month, day) minus the date of birth (year, month, day), the so-called exact age.

Those in the age-group x to $x+4$ years are born during some of the years $t-5, t-4, t-3, t-2, t-1$ or t . Lexis diagram.

The age-specific incidence rate $\frac{d}{n} m_x^t$ for the diagnosis d in the age-group x to $x+n-1$ years during year t is given as

$$\frac{d}{n} m_x^t = \frac{\frac{d}{n} I_x^t}{\hat{L}_x^t} = \frac{\frac{d}{n} I_x^t}{\frac{n P_x^t + n P_x^{t+1}}{2}} \quad \text{where}$$

$\frac{d}{n} I_x^t$ is the number of new cancer cases for the diagnosis d in the age-group x to $x+n-1$ years during year t ;

$$\hat{L}_x^t = \frac{n P_x^t + n P_x^{t+1}}{2} \quad \text{is the mean population of Sweden in the age-group } x \text{ to } x+n-1 \text{ years during year } t;$$

$n P_x^t$ is the population of Sweden at the beginning of year t in the age-group x to $x+n-1$ years;

$n P_x^{t+1}$ is the population of Sweden in the same age-group at the beginning of year $t+1$.

n is equal to 5 for all ages except for those older than 85 where it is an open interval ($85+$ or $85-\omega$).

The crude incidence rate $\frac{d}{m} t$ for the diagnosis d and year t is given as

$$\frac{d}{m} t = \frac{\frac{d}{n} I_x^t}{\hat{L}^t} \quad \text{where}$$

$$\frac{d}{n} I_x^t = \sum_x^{\omega} \frac{d}{n} I_x^t ;$$

$$\hat{L}^t = \sum_x^{\omega} \hat{L}_x^t$$

To be able to compare the cancer incidence in different years - and avoid the influence of differences in age distribution - direct standardization is used to

provide **the standardized incidence rate** $d_m^{\wedge t}$.

$$d_m^{\wedge t} = \sum_x^{\omega} W_{xn} d_{mx}^t \quad \text{where}$$

ω = maximum age

W_{xn} is the percentage of the standard population for the age-group x to $x+n-1$ years.

The standard populations used in this publication are given below.

Age standardized rates for the counties are calculated with weights from the Swedish population January 1, 2000.

Standard populations

Age	The Swedish pop 2000 %	The world population * %
0-4	5.3	12.0
5-9	6.9	10.0
10-14	6.4	9.0
15-19	5.7	9.0
20-24	5.9	8.0
25-29	6.7	8.0

45-49	6.6	6.0
50-54	7.4	5.0
55-59	6.3	4.0
60-64	4.9	4.0
65-69	4.3	3.0
70-74	4.1	2.0
75-79	3.9	1.0
80-84	2.6	0.5
85+	2.3	0.5
Total	100.0	100.0

* Cancer Incidence in Five Continents, Volume VIII, IARC, Lyon 2002.

The linear regression model is of the form $Y = e^{a+bx}$ or equivalent $\ln Y = a + bx$, where

Y = estimated annual age standardized incidence rate per 100 000

x = calendar year minus the midpoint of the period

$$a = \overline{\ln y} = \frac{\sum \ln y}{n}$$

n = number of calendar years

y = observed annual age standardized incidence rate

$$b = \frac{\sum x(\ln y - \overline{\ln y})}{\sum x^2}$$

The variance of the regression coefficient b is

$$s_b^2 = \frac{S^2}{\sum x^2}, \text{ where}$$

S^2 , the variance around the regression line, is defined by the formula

$$S^2 = \frac{\sum (\ln y - \overline{\ln y})^2 - b \sum x(\ln y - \overline{\ln y})}{n - 2}$$

The test statistic $T_{0.02/2} = \left| \frac{b}{s_b} \right|$ corresponds to the Student's t-distribution with $n-2$

degrees of freedom and tests on the 98 per cent confidence level if the slope parameter b in the equation

$\ln Y = a + bx$ deviates significantly from zero.

From the equation $\ln Y = a + bx$ it follows that $Y = e^a e^{bx}$, where e^a represents the geometric mean of the annual standardized incidence rate and $100b$ corresponds to the average annual percentage change.

Coding according to ICD-O/3 and translation to earlier ICD versions

The coding of site has been done according to ICD-O/3. An overview of the coding of site is given in Table W1 as well as translations to other ICD versions.

The side of a pairy organ is coded separately, while . The following sites or subsites are now given side codes:

C06.0	Cheek muccosa
C08.0	Submandibular gland
C08.1	Sublingual gland
C09.0	Tonsillar fossa
C34	Bronchus and lung
C38.4	Pleura, NOS
C40	Bones, joints and articular cartilage of limbs
C41	Bones, joints and articular cartilage of other and unspecified sites
C44.1	Eyelid
C44.2	External ear
C44.6	Skin of upper limb and shoulder
C44.7	Skin of lower limb and hip
C49.1	Connective, subcutaneous and other soft tissues of upper limb and shoulder
C50	Breast
C57.0	Fallopian tube
C57.1	Broad ligament
C57.2	Round ligament
C57.3	Perametrium
C57.4	Uterine adnexa
C62	Testis
C63.0	Epididymys
C63.1	Spermatic cord
C64	Kidney
C65	Renal pelvis
C66	Ureter
C69	Eye and adnexa
C71.0	Cerebreum
C71.1	Frontal lobe
C71.2	Temporal lobe
C71.3	Parieltal lobe
C71.4	Occipital lobe
C71.5	Ventricle, UNS
C72.4	Acoustic nerve
C74	Adrenal gland

Table W1. Translation of site codes from ICD-O/3 to ICD-7 and ICD-O/2 / ICD-10
