Preface

The Swedish Cancer Registry was established in 1958 and has been used to monitor cancer incidence in Sweden and trends over time. The aim is to provide national cancer incidence data to the public in a timely and accurate manner. The purpose of the register is also to provide a data source for clinical and epidemiological research and to facilitate international comparisons.

This publication is the 51st annual report on the incidence of cancer in Sweden from the Swedish Cancer Registry. It comprises the material for 2008 and a description of trends covering the period of 1960-2008. The report is mainly targeted towards the medical community and researchers but of course it may be of interest also to media and the general public.

Site and histopathology ("morphology") of the tumors has been coded in the ICD-O/3 systems of topography and morphology as of January 1st 2005 in the Swedish cancer register. In the present publication, ICD-O/3 figures for coding site have been translated to comply with earlier ICD-7 praxis, and are presented in the main tables according to ICD-7. Table W1 shows that, for all practical purposes, such a translation is feasible.

Sammanfattning

Under 2008 har 51 528 maligna cancerfall diagnostiseras och rapporterats till cancerregistret i Sverige. Könsfördelningen är relativt jämn: 52 procent av fallen är bland män och 48 procent bland kvinnor. Antalet cancerfall har ökat under de två senaste decennierna med en genomsnittlig årlig ökning på 1,8 procent för män och 1,2 procent för kvinnor. Ökningen förklaras till viss del av förändring i befolkningens åldersstruktur men även av screening och förbättrade diagnostiska metoder.

Bröstcancer är den vanligaste cancerformen hos kvinnor och utgör 29 procent av de diagnostisrade fallen. Den genomsnittliga årliga ökningstakten för bröstcancer har varit 1,2 procent under de senaste tjugo åren. Den vanligaste cancerformen bland män är prostatacancer som svarar för 33 procent av fallen under 2008. Incidensen av prostatacancer har i genomsnitt ökat med 2,7 procent per år sett över en period på 20 år men under de senaste åren minskar dock incidensen. Om det är början på en långsiktig nedgång är dock oklart eftersom incidensen av prostatacancer är relaterad till användningen av PSA-test i vården.

Malignt melanom och övrig hudcancer (utom basalcellscancer) utgör sammantaget 14 procent av cancerfallen. Övrig hudcancer är ungefär dubbelt så vanligt som malignt melanom bland män; det är den näst vanligaste cancerformen bland män och den tredje vanligaste bland kvinnor. Förekomsten av både malignt melanom och övrig hudcancer ökar i Sverige och den genomsnittliga årliga ökningstakten är drygt 2 procent för malignt melanom och 3-4 procent för övrig hudcancer.

Tjocktarmscancer är den näst vanligaste cancerformen hos kvinnor och den tredje vanligaste hos män. Sammantaget utgör den 8 procent av fallen som rapporteras till cancerregistret för 2008.

Antalet diagnostisade lungcancerfall bland kvinnor är något lägre för 2008 jämfört med 2007. Men även i detta fall är det oklart om det är ett verkligt trendbrott, då den genomsnittliga årliga ökningstakten är drygt 3 procent baserat på data för de senaste 10 åren. Incidensen av lungcancer är fortfarande högre bland män än bland kvinnor.

Sannolikheten för en man att diagnostiseras med cancer före 75 års ålder är knappt 30 procent och motsvarande sannolikhet för kvinnor är drygt 27 procent.

Summary

During 2008 there were 51 528 cases of cancers diagnosed and reported to the Swedish Cancer Registry; 52 per cent of them in men and 48 per cent in women. During the last two decades the average annual increase in number of cases has been 1.8 per cent for men and 1.2 per cent for women. The increase is partly explained by the ageing population but also by the introduction of screening activities and improvements in diagnostic practices.

Breast cancer is the most common cancer in women representing 29 per cent of the cases in 2008. The average annual increase has been 1.2 per cent during the last two decades. Prostate cancer is the most common cancer in men, representing 33 per cent of the male cases in 2008. On average, the incidence has increased by 2.7 per cent annually seen over the last 20 years but has decreased during the last few years. It is uncertain whether this is the start of a continuing decreasing trend as the incidence of prostate cancer is related to the use of PSA-testing.

Malignant melanoma and other skin cancer (except basal cell carcinoma) represent 14 per cent of the cancer cases in Sweden. Skin cancer is more common than malignant melanoma and is the second most common cancer in men, and the third in women. The incidence trend is increasing for both sexes and is higher in women than in men.

Colon cancer is the second most common cancer in women, and the third in men, corresponding to 8.0 per cent of the total number of cases.

The number of cases of lung cancer among females is slightly lower for 2008 compared to 2007. However, based on data for the last 10 years there is an average annual increase of 3.1 per cent among females, while there is a decreasing trend among males. Lung cancer is still more common among males than females.

The probability of developing cancer before the age of 75 is 30 per cent among men and 27 per cent among women.

Material

According to Regulations by the National Board of Health and Welfare (SOSFS 2006:15) all physicians in hospitals and other establishments for medical treatment under public or private administration in Sweden must report all malignant and certain benign tumors ("Clinical report", Appendix 3) to the Cancer Register. Furthermore, pathologists and cytologists separately report every tumor diagnosed from surgically removed tissues, biopsies, cytological specimens, bone marrow aspirates and autopsies. Thus, the majority of cases are notified twice, in separate reports. Only persons that have official residency in Sweden are included in the Cancer Register.

The registration of new cancer reports and the major check-up and correction work is performed by six regional cancer registers covering the whole country. These registers are associated with the oncological centre in each medical region of Sweden (Stockholm-Gotland, Uppsala-Örebro, Linköping, Lund-Malmö, Göteborg and Umeå). The regionalization implies a close contact between the register and the reporting physician which in turn alleviates the task of correcting and checking the material. Annually the regional registers send information of newly registered cases and corrections concerning those previously reported to the national Cancer Register. The present publication comprises statistics on cases of cancer diagnosed in 2008.

The following diseases are to be reported to the national Cancer Register.

- A All definitely malignant neoplasms (e.g. carcinoma, sarcoma, malignant lymphoma, leukemia and malignant teratoma).
- B Carcinoid tumors of digestive and other organs, granulosa cell tumors of the ovary, thymomas, adamantinomas and chordomas.
- C Histologically benign tumors of the central nervous system and meninges, transitional cell papillomas of the urinary tract, all hormonally active tumors of the endocrine glands (except the thyroid) and the entero-chromaffin and neuroendocrine systems.
- D Precancerous lesions of lip, mouth, larynx, bronchus, trachea, cervix uteri, skin, vulva and vagina, gastro-intestinal polyps with suspected malignancy, "bronchial adenomas", atypical epithelial proliferations of the breast (carcinoma in situ type) and adenoma phyllodes, precancerous endometrial lesions, hydatidiform moles of placental tissue, and ovarian cystadenomas of borderline type.

If a person has more than one primary tumor, each tumor is registered separately. This also applies for tumors appearing in the same parenchymal or-

gan, provided the neoplastic tissues and histogenetic properties differ among the tumors (for instance, if one neoplasm is a carcinoma and another a sarcoma). Each new primary tumor in the skin, intestine and urinary tract is registered.

Information from death certificates is available to the Register, supplying date and cause of death. Death certificates until December 31, 2007 have been merged with the files of the Cancer Register 1958-2008. In the Cause of Death Register, 2007 is the last year available. Cancer diagnoses based on death certificates only are not included in the Cancer Register.

The persons in the Cancer Register have also been followed up regarding migration through Statistics Sweden.

Information in the Cancer Register

Data in cancer reports

- Personal identification number composed of 8 digits based on century, year, month and day of birth, supplemented with the so-called registration number (3 digits) and a check digit
- Sex
- Domicile (county, municipality, parish)
- Reporting hospital
- Reporting hospital department
- Reporting pathology/cytology department
- Unique tumor specimen number, including year when specimen was taken
- Site of tumor. The basic coding has been performed according to:
 - ICD-7 1958-1986 (WHO/HS/CANC/24.1)
 - ICD-9 1987-1992 (WHO 9th revision 1976)
 - ICD-O/2 1993-2004 (2nd Edition. WHO Geneva 1990)
 - ICD-O/3 2005-w (3rd Edition. WHO Geneva 2000)The different classifications are translated to ICD-7 to enable longer trends. For exceptions cf. Appendix 1.
- Histological type (WHO/HS/CANC/24.1 Histology Code). From 1993 according to ICD-O/2 (2nd Edition. WHO Geneva 1990) and from 2005 according to ICD-O/3 (3rd Edition. WHO Geneva 2000)
- Tumor serial number
- Malignancy (yes/no)
- Stage according to
 - FIGO (www.figo.org) for gynecological tumors
 - TNM (TNM Classification of Malignant Tumors, 6th Edition, 2002, Leslie H. Sabin and Ch. Wittekind) for other tumors except brain and central nervous system, lymphoma, leukemias and metastases where primary tumor is unknown
- Basis for TNM-stage (clinical or pathological)
- Basis of diagnosis:
 - 1 Clinical diagnosis only
 - 2 X-ray
 - 3 Histological examination of surgical or biopsy material (patho-anatomic diagnosis, "PAD")
 - 4 Autopsy with histopathological examination of surgical or biopsy material

- 5 Cytological diagnosis
- 6 Gross examination at surgery
- 7 Autopsy without histopathological examination
- 8 Other
 - Date of diagnosis (century, year, month, day)
 - Diagnosis made incidentally at autopsy (yes/no)

Data from the Cause of Death Register

- Date of death (century, year, month, day)
- Cause of death. Main underlying cause, according to:
 - ICD-7 1958-1968
 - ICD-8 1969-1986
 - ICD-9 1987-1996
 - ICD-10 1997-w

Reporting procedures and controls of the material

The reports are registered continuously at the regional cancer registers. Usually a notification from the pathology/cytology lab arrives first, followed by a clinical notification. Whenever reports arrive separately, they are registered with a flag to show that one report is lacking. If the missing report does not arrive within three months, a reminder is sent out. In 30-40 per cent of the cases, reports have to be traced according to this scheme. If the missing report does not arrive, the required information can be taken from the hospital case record, if available. If this source of information is also lacking, registration is done on the basis of the information that is available at hand. The percentage of cases with such an incomplete registration is less than two per cent.

A small number of cases (annually some hundred) are reported too late to be included in the publication. These cases are added to the register the following year.

An estimation of the underreporting of cancers can be done by comparing the Cancer Register data with the Cause of Death Register (see chapter Validity of the data).

The material passes through the following controls:

- the identification number is checked against the register covering the total population of Sweden
- duplicates are subject to special checking
- the validity and logical contents of the codes are checked when the material is processed.

Validity of the data

Approximately 99 per cent of the cases are morphologically verified (Table 8). The reliability of the diagnosis may vary with the hospital, department and/or physician concerned; this may add to a geographical variability, though the structure of the public health system is homogeneous. The availability of facilities for pathology service likewise varies. The reliability of the diagnosis also varies with age and type of disease.

The figures on incidence from the Cancer Register include data on cases of cancer found incidentally at autopsy. The contribution from this additional source varies with site and type of tumor. Variations in the incidence of a particular type of tumor in a certain geographical region may partly be due to differences in frequency and thoroughness of the autopsy examination and the histologic examination of the autopsy specimens. Cancer of bronchus/lung, pancreas, colon, liver and prostate are often overlooked at clinical examinations but are found incidentally at autopsy. Table 3B gives the number of cases found incidentally at autopsy by site, sex and medical region.

The Swedish Cancer Register does not use information on cancers based on death certificates, the reason being that the data on the death certificates in many instances are uncertain - especially regarding old persons - as shown in a separate analysis [1].

In 2007, there were 2 954 persons in the Cause of Death Register with cancer stated as underlying cause of death which were not on file in the Cancer Register 1958-2007. The most common cancer sites were - as noted previously - bronchus/lung, pancreas and prostate. The distribution by sex, age, and autopsy is shown in Table A1 and Table A2. The figures show that most of the cases are 75 years of age, or older, and not autopsied. As the Cause of Death Register has not been updated to 2008, 2007 is the last year available.

A study of the completeness of the Cancer Register was published in 2009. The study compared the Cancer Register with the National Patient Register and showed an underreporting of approximately 3.7 per cent for the year 1998. The degree of underreporting varied with site, increased with age and diagnoses without histology or cytology verification were overrepresented. Consequently, the underreporting does not seem to be random. Nevertheless, the overall completeness of the Cancer Register is considered high and comparable to other high quality registers in northern Europe. [2]

Statistical terms

Age

The age of the patient at the date of diagnosis.

Crude incidence rate

The total number of cases divided by the corresponding mean population per 100 000. Rates for males and females are calculated separately.

Age-specific incidence rate

Number of cases for each five-year age-group divided by the corresponding mean population per 100 000. Rates for males and females are calculated separately.

Age standardised incidence rate

The incidence rate is standardised according to the age distribution in the Swedish population January 1, 2000. In order to facilitate international comparisons, the incidence rates have also been standardised according to the world standard population in some tables. See Appendix 2 for a description of the standard populations. The method for calculating the age standardised incidence rate is described in Cancer Incidence in Five Continents. [3]

Cumulative probability of developing cancer

The cumulative probability to develop a cancer before a certain age has been estimated from the age-specific incidence rates in Table 4. [3]

Trend

The estimated annual percentage change is used to describe the magnitude of change in the trend on fitting a simple regression model to the log of the age-standardised incidence rate. It is the *average* annual rate of change over the time period selected, here the last 10 and 20 years.

The incidence rates for the period 1960-2008 are presented graphically in Figure 4a-22a for groups of cancer sites and some specified sites. The trends over time are based on the age-standardised incidence rates.

Comparisons between trends covering different time periods should be made with caution since diagnostic methods may vary, and coding practices change. Furthermore, in the trend periods shown in the present publication, the age structure of the population, the autopsy frequency (recent figure 14 per cent, compared to 50 per cent in the seventies), and type and forms of screening activities vary.

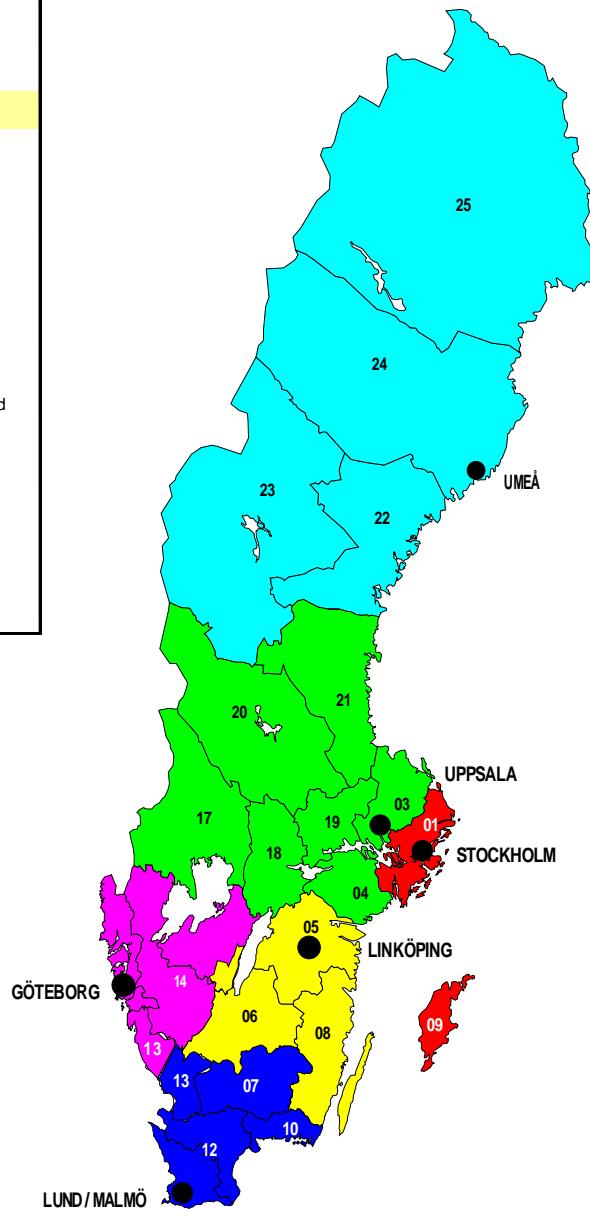

The population of Sweden

The life expectancy at birth in Sweden for 2008 was 79.1 years for males and 83.2 for females. Some demographic data for the population are given in Tables B1 and B2 [4]. Sweden is divided into six medical regions. Below is a map of Sweden illustrating the counties associated with each region.

The number of deaths in Sweden was 44 025 males and 47 795 females in 2007. There were 11 586 males and 11 045 females registered with a death due to cancer in the Cause of Death Register which corresponds to approximately 25 per cent of all deaths. [5]

Total cancer incidence 2008

The incidence is based on a total of 51 528 cancers reported to the Swedish Cancer Register in 2008, 418 of which were found incidentally at autopsy. The number of persons with cancer diagnosed for the first time in 2008 was 42 091 (22 011 males and 20 080 females); thus 9 437 cancers were diagnosed in persons with at least one previous cancer diagnosis. The distribution of all reported cancers by site and by sex is given in Table D.

Figure 1a and 1b illustrate how the trend in incidence rates vary depending on the choice of standard population as well as lack of standardisation (i. e. crude rate). The weights for each standard population is presented in appendix 2.

Figure 2a and 2b show the percentage distribution of the ten most common forms of cancer.

Probability of developing cancer

The probability, or risk, of developing cancer varies strongly with age and by site. The cumulative rate, based on the age-specific rates in Table 4, is used to estimate the probability of developing cancer. The method is described in detail in Cancer Incidence in Five Continents. [3]

The method does not take into account competing risks, such as risk of death. As the risk of death increases with age, the estimates may be less valid with increasing age. Consequently, we present the estimated probability up until the age 75 in Table E. Only sites with a life-time probability (up to age 75) of approximately one per cent are presented.

Overall, the risk of developing a cancer before the age 75 is 29.9 per cent among males and 27.1 per cent among females.

CANCER INCIDENCE IN SWEDEN 2008

		F	0.1	0.4	0.8	1.2	2.0	3.2

Note. The probability has been estimated from the age specific rates in Table 4.

Trends in cancer incidence

Factors that affect trends include changes in coding practices, age structure of the population at risk, and the autopsy frequency, as well as the introduction of screening activities and improvements in diagnostic practices. For this reason, conclusions may be difficult to draw from trend figures covering long time periods. In the presentation of the trends, we present estimates of annual percentage change in incidence both for the last 10- and 20-year periods (Table F).

The number of cancer cases diagnosed and reported to the Cancer Registry in Sweden has increased during the last two decades. The average annual increase is 1.8 per cent for men and 1.2 per cent for women. About half of this increase is explained by the continuous ageing of the population. This is seen in the graphs in Figure 1a and 1b where the crude rates are compared with age standardised rates. During recent years the trend regarding number of cases is decreasing among males. This is largely explained by a reduction in number of prostate cancer cases (Figure 3a and 14a).

The average annual changes in time trends are calculated according to an exponential model with the age standardised incidence rates as point estimates.

The average annual increase in the age standardised rates for all cancer is 0.8 per cent for men and 0.6 per cent for women during the last 20 years. The corresponding figure for the period 1999-2008 is 0.5 for males and 0.7 for females.

Comments about trends in age standardized incidence in selected sites:

- **Head and neck (ICD-7 140-148)** The incidence of cancer in the head and neck region has an estimated declining trend among males (0.6 per cent annually) and a rising trend among females (1.3 per cent) during the last 20 years. The incidence of lip cancer in males is continuously decreasing with an estimated annual decrease of 4.2 per cent since 1989. Cancer in the mesopharynx is also rare but with an increasing trend of 3.4 per cent per year among males and 3.3 per cent among females during the last 20 years.
- **Digestive tract, upper (ICD-7 150-152)** There is a remarkable annual decrease in incidence for both men and women during the 20-year period (2.5 per cent for men and 2.3 per cent for women) which is mainly attributed to a reduction in stomach cancer incidence.
- **Colon and rectum (ICD-7 153-154)** Cancer of colon and rectum are among the most common cancer sites in both males and females and the trend is rather stable although colon cancer in women has increased with 1.5 per cent per year on average during the last decade.
- **Hepatobiliary and pancreas (ICD-7 155-157)** There is an average decrease of 3.3 per cent per year in women and 2.8 per cent in men

		F	1.2 *	1.4 *	19 815	22 003	24 864

* Implies that the trend is considered to be strictly increasing or decreasing at the 99% confidence level

since 1999. The declining trend is observed in both cancer of the liver and pancreas.

- **Respiratory tract, lower (ICD-7 162-163)** The vast majority of cases in this group is primary lung cancer. There is a continuous increase in incidence of lung cancer in women, 3.1 per cent per year for the last 20-year period, while the trend in males is decreasing annually with 0.7 per cent during the last 20-year period. Lung cancer is still more common in males than in females despite the rising trend among females.
- **Breast (ICD-7 170)** Breast cancer incidence in women has increased with 1.2 per cent annually during the last 20 years but the increase in the recent 10-year period is weaker with an annual change of 0.8 per cent. It is the most common cancer in women but a very rare diagnosis among men.
- **Female genital organs (ICD-7 171-176)** There is a slight declining trend regarding cancer in the female genital organs. Cancer of the corpus uteri is the most common in this group and has a slightly increasing trend of 1.0 per cent annually based on the last 20 years although the increase has diminished during the last decade. Both cancer of cervix uteri and ovaries are decreasing based on data for the last 20 years (by 1.0 resp 2.0 per cent annually) but during the last decade the trend regarding cervical cancer is rather stable.
- **Prostate (ICD-7 177)** Prostate cancer is the most common cancer in men and the average annual increase is 2.7 per cent over the last 20 years and 0.8 per cent over the last 10 years. The introduction of PSA testing explains the large increase in the late 1990s and early 2000s but the incidence has decreased during the last few years.
- **Male genital organs (ICD-7 178-179)** There is an increasing trend in incidence of cancer in the male genital organs, 1.6 per cent annually. This is mainly attributable to testicular cancer, which has an annual increase of approximately 2 per cent in the last 10 years.
- **Malignant melanoma of skin (ICD-7 190)** Seen over the last decade, malignant melanoma is one of the most rapidly increasing malignant tumors in Sweden. For males, the average increase per year is 4.1 per cent and for females it is 4.2 per cent.
- **Skin, non-melanoma (ICD-7 191)** Non-melanoma skin cancer consists mainly of squamous carcinoma (basal cell carcinoma is excluded) and seen over the last decade, this is one of the most rapidly increasing malignant tumors in Sweden. An average annual increase of 3.9 per cent is observed for men and 5.9 for women in the last 10-year period.
- **Malignant lymphoma (ICD-7 200-202, 204.1) and Leukemia (ICD-7 204-207, excluding 204.1)** There is a slightly increasing trend regarding malignant lymphoma and leukemia in women during the past 20 years. However, the trend is stable when restricting the timeframe to the last decade.

The incidence rates of cancer in the above mentioned groups of cancer sites during the period 1960-2008 are plotted and presented in Figures 3a-22a .

For some sites, the number of cases are few and random variation may play an important role for the configuration of the graphs. The time trend of specific cancer sites is available from the statistical database on the Socialstyrelsen website [6] alternatively from the NORDCAN database [7]

Please note that different scales are used among the figures. The rates are age standardised according to the Swedish population January 1, 2000.

Age-specific cancer incidence

Figure 3b shows the age distribution of cancer cases in absolute numbers in five-year age groups and figure 4b-22b shows the age-specific incidence in the corresponding age groups. In order to reduce the influence of random variation and consequently present reliable information, the figures are based on data for the five most recent diagnostic years, that is 2004-2008.

The figures present combined groups of cancer sites and some of the most common cancer sites. The age distribution of specific cancer sites is available from the statistical database on the Socialstyrelsen website [6] alternatively from the NORDCAN database [7].

The figures show that most cases are diagnosed in persons above the age of 65. In the age groups from 30-34 to 55-59, the incidence is higher among females than males (see Figure 4b), mostly due to the dominance of cancer in the breast and female genital organs. Approximately 65 per cent of the male and 55 per cent of the female cancer patients are 65 years or more at the time of diagnosis.

Appendix 1

The major exceptions from the codes in the 7th WHO revision

(WHO/HS/Canc/24.1. Code for anatomical location).

- Site 158 (peritoneum) only includes malignant mesotheliomas of peritoneum, while metastatic lesions are referred to site 199.3.
- Site 159 (unspecified digestive organs) has not been used. Such cases are included in site 199.
- Site 162.2 (pleura) only includes malignant mesotheliomas.
- Site 164 (mediastinum). Thymomas are referred to site 195.2.
- Site 172 (corpus uteri) only includes malignant epithelial tumors of the mucosa.
- Site 173 only includes malignant chorionic lesions (invasive mole and choriocarcinoma).
- Site 174 (uterus, unspecified) includes carcinomas growing in both corpus and cervix uteri (or carcinoma uteri NOS), and uterine sarcomas.
- Site 180.1 and 181 include papillomas of the urinary tract.
- Site 191. Basaliomas are excluded.
- Site 193.0 and .1 include histologically benign tumors of the central nervous system and meninges.
- Site 193.3 includes malignant tumors of peripheral nerves and the sympathetic nervous system, irrespective of possible organ connection.
- Site 195 (other endocrine glands) includes all benign and malignant tumors, though adrenocortical adenomas have been included only if they have given endocrinological symptoms.
- Site 197 includes soft tissue sarcomas without organ connection, and also retroperitoneal tumors (197.4).
- Site 198 (lymph nodes) has not been used. Metastatic tumors have been referred to site 199.
- Site groups 204-207 (leukemia) are coded according to ICD-8.
