# Preface

The Swedish Cancer Registry was established in 1958. Since 1991, it is part of the Centre for Epidemiology (EpC). In this publication the National Board of Health and Welfare presents its 38th report on the incidence of cancer in Sweden. It comprises the material for 1996 and a description of trends covering the period of 1960-1996.

Compared to the 1992 and previous reports, data on second and multiple primary tumors are added, and some changes in the names of the tables and the order of the figures have been made. Furthermore, a comment is made on certain discrepancies between the registration of cancer in the Cancer Registry and the Cause of Death Registry and their impact on the reliability of the incidence figures.

In accordance with an agreement between the five Nordic Cancer Registries, and the regional registries in Sweden, site and histopathology ("morphology") of the tumors has been coded in the ICD-O-2/ICD-10 systems of topography and morphology as of January 1st 1993. With these systems, a more detailed information is obtained (especially with regard to the morphology) than was previously possible with the ICD-7/WHO/HS/CANC/24.1 coding principles; further, the coding systems in the Cancer Registry will in the future be comparable with ICD-10 when used in its clinical context.

In the present publication, ICD-O-2/ICD-10 figures for coding site have been translated to comply with earlier ICD-7 praxis, and are presented in the main tables according to this praxis. **Table W1** and **Table W2** show that, for all practical purposes, such a translation is feasible.

Appendix 3	Form used for clinical report	101
Appendix 4	Form used for cytology/pathology report	102
Appendix 5	Map of Sweden	103

# 1 Material

According to Regulations by the National Board of Health and Welfare (SOSFS(M) 1984:32) all physicians in hospitals and other establishments for medical treatment under public or private administration in Sweden must report all cases of cancer ("Clinical report", on Form A cf. Appendix 3) to the Cancer Registry. Furthermore, pathologists and cytologists separately report every cancer diagnosis on surgically removed tissues, biopsies, cytological specimens and autopsies (including forensic necropsies) ("Pathology report", Form B cf. Appendix 4) to the Registry. Thus, the majority of cases are notified twice, in separate reports.

The registration of new cancer reports and the major check-up and correction work is performed by six regional cancer registries covering the whole country. These registries are associated with the oncological centre in each medical region of Sweden (Stockholm-Gotland, Uppsala-Örebro, Linköping, Lund-Malmö, Göteborg and Umeå). The regionalization implies a close contact between the registry and the reporting physician which in turn alleviates the task of correcting and checking the material. The regional registries send annual information about the newly registered cases and corrections concerning those previously reported to the National Cancer Registry.

The present publication comprises statistics on cases of cancer diagnosed in **1996**.

The following diseases are to be reported to the National Cancer Registry.

- A All definitely malignant neoplasms (e.g. carcinoma, sarcoma, malignant lymphoma, leukemia and malignant teratoma).
- B Carcinoid tumors of digestive and other organs, granulosa cell tumors of the ovary, thymomas, adamantinomas and chordomas.
- C Histologically benign tumors of the central nervous system and meninges, transitional cell papillomas of the urinary tract, all hormonally active tumors of the endocrine glands (except the thyroid) and the entero-chromaffin and neuroendocrine systems.
- D Precancerous lesions of lip, mouth, larynx, bronchus, trachea, cervix uteri, skin, vulva and vagina, gastro-intestinal polyps with suspected malignancy, "bronchial adenomas", atypical epithelial proliferations of the breast (carcinoma in situ type) and adenoma phyllodes, precancerous endometrial lesions, hydatidiform moles of placental tissue, and ovarian cystadenomas of orderline type.

Diseases mentioned under A - C are included in the total cancer incidence (Tables F, G, I and 1-11), although a number of the tumors listed under C are considered not to be "infiltrating and metastasizing" (Table G).

The benign tumors and precancerous lesions mentioned under D are listed in Table H.

Basal cell carcinoma (basalioma) have not been registered.

If a person has more than one primary tumor, each tumor is registered separately. This also applies for tumors appearing in the same parenchymal organ, provided the neoplastic tissues and histogenetic properties differ among the tumors (for instance, if one neoplasm

is a carcinoma and another a sarcoma). Each new primary tumor in the skin, intestine and urinary tract is registred.

Information from death certificates is available to the Registry, supplying date and cause of death. The death certificates up to **January 1, 1997** have been merged with the files of the Cancer Registry. Cancer diagnoses based on death certificates only are not registered. This information, though, can be obtained from other sources.

The persons in the Cancer Registry have also been followed up regarding to emigration trew Statistics Sweden.

## 2 Information available in the Cancer Registry

### 2.1 *Data in cancer reports*

- Unique personal identification number composed of 8 digits based on century, year, month and day of birth, supplemented with the so-called registration number (3 digits) and a check digit
- Sex
- Name
- Domicile (county, municipality, parish)
- Hospital
- Hospital department
- Hospital-record, number and year
- Pathology/cytology department
- Specimen number, and year when specimen was taken
- Site of tumor. The Registry has ever since 1958 and still, mainly followed a code based on the 7th WHO revision (WHO/HS/CANC/24.1 Code for Anatomical Location). For exceptions cf. Appendix 1. For the years 1987-1992, the ICD-9 coding system have been used and 1993-w the ICD-O-2/ ICD-10
- Tumor serial number
- Malignancy (yes/no)
- Histological type (WHO/HS/CANC/24.1 Histology Code) and from 1993 according to SNOMED
- Basis of diagnosis:
  - 1 Clinical diagnosis only
  - 2 X-ray
  - 3 Histological examination of surgical or biopsy material (patho-anatomic diagnosis, "PAD")
  - 4 Autopsy with histopathological examination of surgical or biopsy material
  - 5 Cytological diagnosis
  - 6 Gross examination at surgery
  - 7 Autopsy without histopathological examination
- Date of diagnosis (century, year, month, day)
- Death from cancer (yes/no)
- Diagnosis made incidentally at autopsy (yes/no)

### 2.2 *Data from death certificates*

- Date of death (century, year, month, day)
- Cause of death. Main underlying cause, according to:
 

ICD-6	1958-1960,
ICD-7	1961-1968,
ICD-8	1969-1986,
ICD-9	1987-w
- Contributing cause of death, if cancer.

### 3 Reporting procedures and controls of the material

The reports are registered continuously at the regional cancer registries. Usually, the pathology/cytology (B) report arrives first, followed by the clinical (A) report. Whenever reports arrive separately, they are registered with a flag to show that one report is lacking. If the missing report does not arrive within three to nine months, a reminder is sent out. In 20-30 per cent of the cases, reports have to be traced according to this scheme. If the missing report does not arrive, the required information can be taken from the hospital case record, if available. If this source of information is also lacking, registration is done on the basis of the information that is available on the A or B report at hand. The percentage of cases with such an incomplete registration is less than two per cent.

A small number of cases (annually some hundred) are reported too late to be included in the publication. These cases are added to the registry whenever they arrive.

An estimation of the drop-out rate of cancers can be done by comparing the Cancer Registry data with the Cause of Death Registry (see next chapter).

The material passes through the following controls:

- the identification number is checked against the register covering the total population of Sweden
- duplicates are subject to special checking
- the validity and logical contents of the codes are checked when the material is processed.

## 4 Validity of the data

Approximately 97 % of the cases are morphologically verified. The reliability of the diagnosis may vary with the hospital, department and/or physician concerned; this may add to a geographical variability, though the structure of the country's public health system is homogeneous. The availability of facilities for pathological diagnosis likewise varies. The reliability of the diagnosis also varies with age and type of disease.

The figures on incidence from the Cancer Registry include data on cases of cancer found incidentally at autopsy. The contribution from this additional source varies with site and type of tumor. Variations in the incidence of a particular type of tumor in a certain geographical region may partly be due to differences in frequency and thoroughness of the autopsy examination and the histologic examination of the autopsy specimens. Cancer of bronchus/lung, pancreas, colon, liver and prostate are often overlooked at clinical examinations but are found incidentally at autopsy. **Table 3B** gives the number of all cases found incidentally at autopsy by site, sex and medical region.

The Swedish Cancer Registry does not use information on cancers based on death certificates only, the reason being that the data on the death certificates in many instances are uncertain - especially regarding old persons - as shown in a separate analysis (1).

In **1996**, there were **2040** persons in the Cause of Death Registry with cancer stated as underlying cause of death which were not on file in the Cancer Registry. The most common cancer sites were - as noted previously - bronchus/lung, pancreas, colon, liver and prostate. The distribution by sex, age, and autopsy is shown in **Table A1** and **Table A2**. The figures show that most of the cases are 75 years of age or older and not autopsied.

## 5 Statistical terms

**Age.** The age of the patient at the date of diagnosis.

**Crude incidence rate.** The total number of cases divided by the corresponding mean population per 100 000. Rates for males and females are calculated separately.

**Age specific incidence rate.** Number of cases for each five year age-group per 100 000 of the mean population, in that age-group. Rates for males and females are calculated separately.

**Age standardized incidence rate.** In **Tables E, I and 4 - 6**, the figures have been adjusted for age to a Swedish standard population (the 1970 census). In order to facilitate international comparisons, the incidence rates have also been adjusted to the world standard population (**Tables E, 4 and 7**). In the latter table the sites 204-209 (leukemia, polycythæmia vera and myelofibrosis) are aggregated. The standard populations and more details on definitions of statistical terms are given in Appendix 2.

**Trend.** The trends over time are calculated from the age adjusted figures on tumor rates in the 18 different age groups. In **Table I** the trend figures for both **the last 10 and 20** years are presented. The time series of age standardized rates plotted in **Figures F1-F23** cover the whole period **from 1960 to 1996**.

Comparisons between trends covering different time periods should be made with caution since diagnostic methods may vary, and coding practices change. Furthermore, in the trend periods shown in the present publication, the age structure of the population, the autopsy frequency (recent figure 20 per cent, compared to 50 per cent in the seventies), and type and forms of screening activities vary.

## 6 The population of Sweden

The life expectancy at birth in Sweden for 1996 was **75.9** years for males and **81.2** for females. Some demographic data for the population are given in **Tables B - D**.

**Table B: Selected population data for Sweden 1996**

	<i>Males</i>	<i>Females</i>	<i>Total</i>
Mean population	4 367 894	4 473 104	8 840 998

## 7 Total cancer incidence 1996

The incidence is based on a total of **42 839 cancers** reported to the Swedish Cancer Registry in **1996**; **1 134** cases of them were found incidentally at autopsy.

The number of **persons** with cancer diagnosed for the first time in **1996** was **37 011** (18 462 males and 18 549 females); thus, **5 828** cancers were diagnosed in persons with two or more primaries. The distribution of all reported cancers is given by sex in **Table E** below.

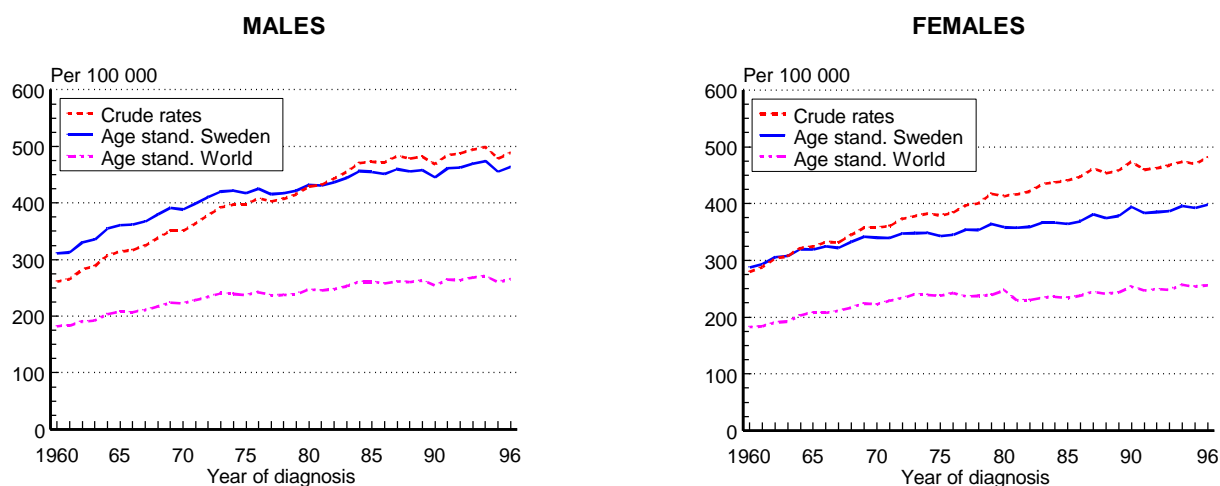

**Table E: Cancer Incidence in Sweden 1996**  
Total numbers and total rates per 100 000, by sex

	Sex	New cases	Rates per 100 000		
			Crude rate	Sweden*	World**
All tumors	M	21 326	488.2	463.9	265.1
	F	21 513	480.9	397.7	256.0
	<b>M+F</b>	<b>42 839</b>

**Figure A: Cancer Incidence in Sweden 1960-1996**  
Comparison between different methods of calculating incidence rates per 100 000, by sex

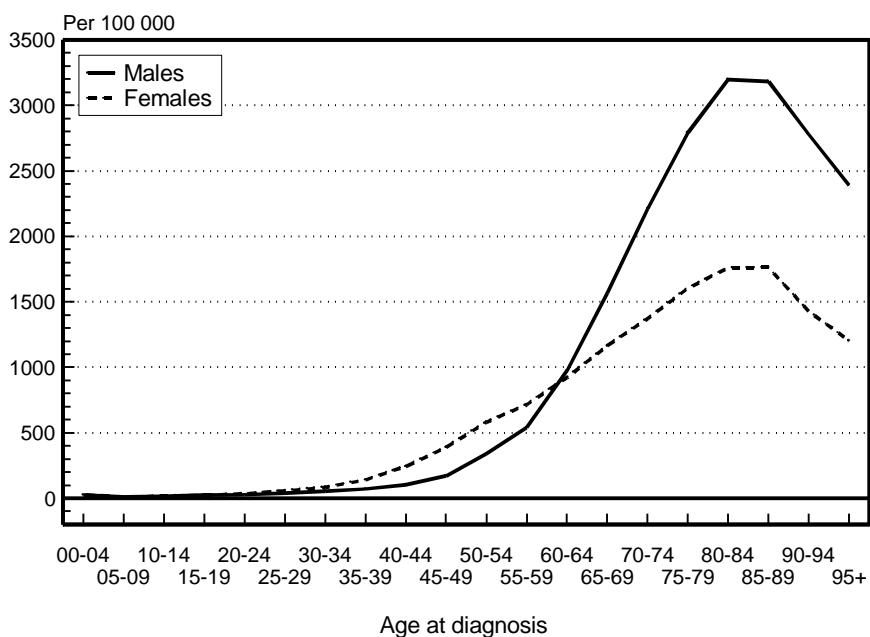

The percentage distribution of the ten most frequent forms of cancer is given in **Figure B** below. The cases cover **75.3** per cent of all male cancer. The corresponding figure for females is **68.6** per cent.

**Figure B: Cancer Incidence in Sweden 1996**  
The ten most frequent specified cancer sites, by sex

The age-specific incidence rates for all cancer are shown in **Figure C**. The graph illustrates that cancer mainly is a disease of the older age groups. In the age groups from 25-29 to 55-59 years, the incidence is higher among females, mostly because of the dominance of breast and genital cancer.

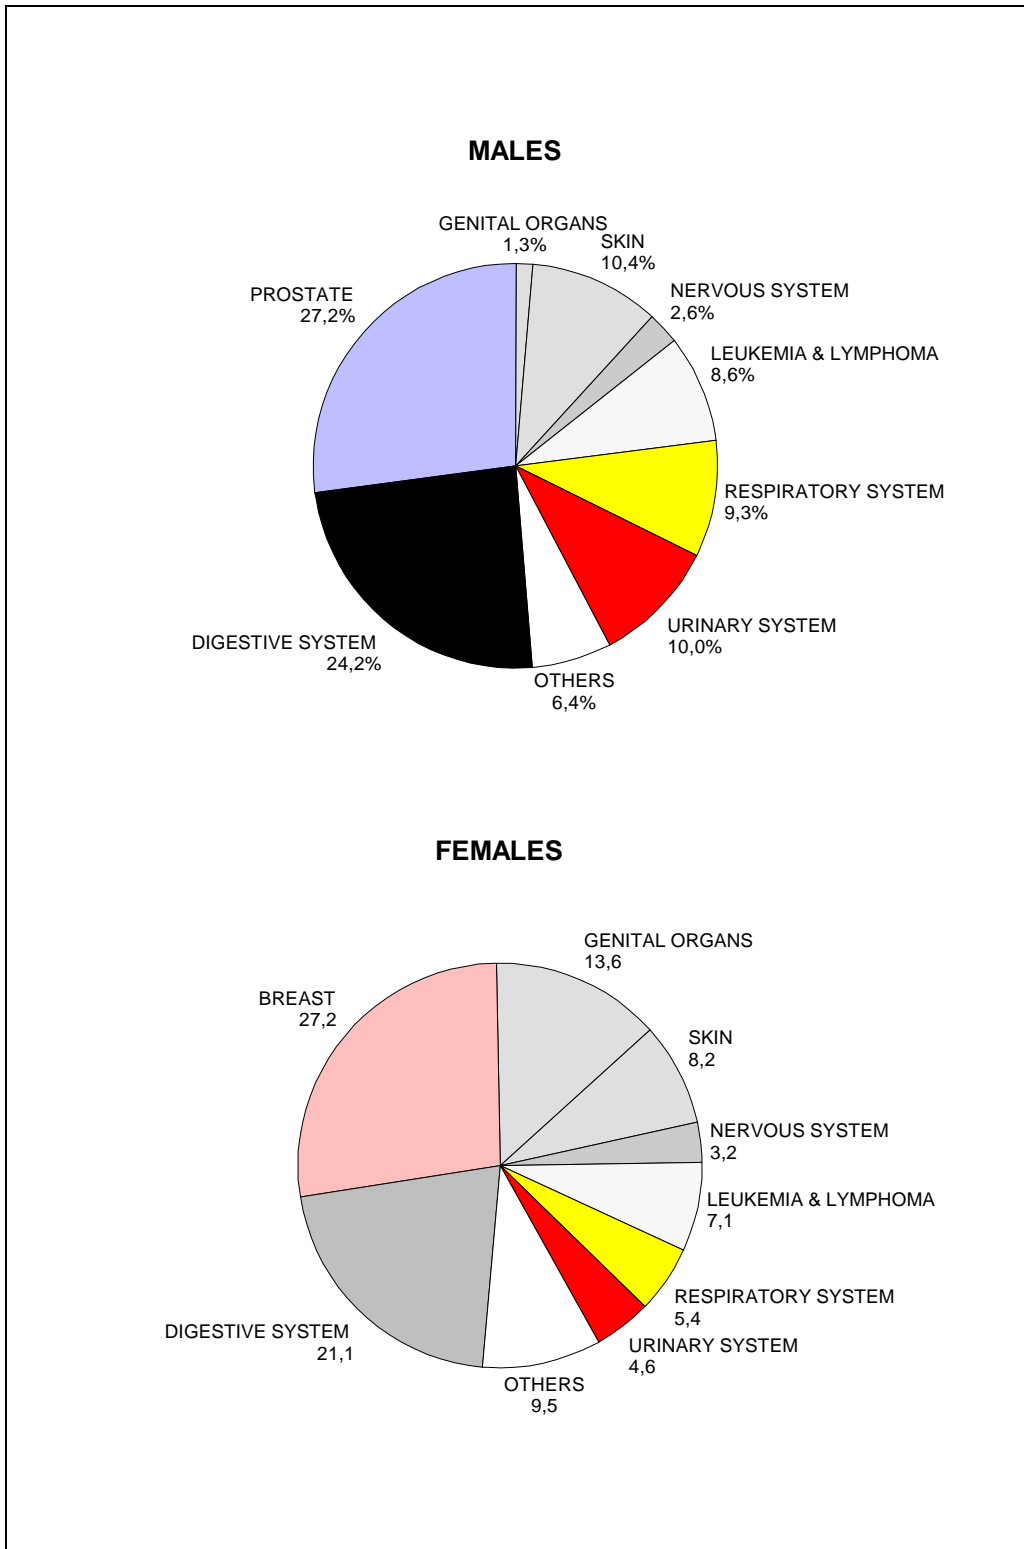

**Figure C: Cancer Incidence in Sweden 1996**  
Age-specific incidence rates per 100 000. All sites, by sex

In **Figure D**, some closely related cancer sites have been grouped and presented by sex. The distribution by individual site and sex (with minor exceptions), is shown in **Table F**.

**Figure D: Cancer Incidence in Sweden 1996**  
**Grouped cancer sites, by sex**

## 8 Trends in the cancer incidence

Factors that affect trends include changes in coding practices, age structure of the population at risk, and the autopsy frequency, as well as the introduction of screening activities and improvements in diagnostic practices. For this reason, conclusions may be difficult to draw from trend figures covering long time periods. In the presentation of the trends, we have chosen to give figures both for a 20-year period and the latest decade (**Table I**). The effect of this measure becomes apparent in several sites, for instance men in ICD-7 site 193, central nervous system (see **Table I** and **Figure 22**). Thus, the 20-year trend shows an annual increase of 0.7 per cent, while the trend of the latest decade is an annual decrease of 1.0 per cent.

The annual number of cancer cases in Sweden has increased constantly during the period of **1960-1996**, as can be seen in **Figure E**. The average annual increase is **2.1** per cent for both men and women. Almost half of this increase is explained by the continuous change in age structure of the population. This is seen in the graphs in **Figure A** (page 15) where the crude rates are compared with age standardized ones. When the number of cancer cases is considered over the period **1977-1996**, the average annual increase is **1.4** per cent both for men and women.

In **Table I**, concerning the years **1977-1996**, the average annual changes in time trends are calculated according to an exponential model (the end of **Appendix 2**) with the age standardized incidence rates as point estimates. Changes in trend are given for the whole period, and for the latest 10-year period separately.

The average annual increase in the age standardized rates for all cancer is **0.6** per cent for men and **0.7** for women during the complete period. The figure for the period **1987-1996** is **0.2** for males and **0.5** for females.

**An increase in the trend for the years 1977-1996** is seen e. g. for the following sites

- **malignant melanoma of skin.** Seen over a 20-year period, this is one of the most rapidly increasing malignant tumors in Sweden. For men, the average increase per year is **3.5** per cent and for women slightly less (**2.3** per cent). The increase is less prominent during the last 10-year period.
- **non-melanoma skin cancer** (mainly squamous carcinomas). An average annual increase of **4.0** per cent is observed for men and **4.1** for women. This is for men the most rapidly increasing malignant tumor during the latest 10-year period studied (**3.1** per cent for men and **3.3** per cent for women).
- **bronchus and lung, primary.** Women show a rather strong average increase per year, **3.8** per cent, while the previously noted increasing trend in males has now turned to a decrease of **0.8** per cent calculated for the whole period. The decrease is more pronounced if only the latest period studied is taken into account. The gap between the incidence curves for both sexes is, however, still considerable.
- **breast cancer in women.** The annual increase is **1.3** per cent for the whole period but **1.2** per cent if only the latest 10-year period is considered.
- **prostate.** This is the most common cancer site in men with an average annual increase of **1.8** per cent. For the last 10-year period the increase is slightly less (**1.7** per cent).

- **urinary tract (excluding kidney).** The figure for the whole period for men is increasing by **1.2** per cent a year, while the corresponding figure for women is **0.9** per cent.
- **malignant non-Hodgkin's lymphoma.** The average annual increase for the whole period is **2.4** per cent for men and **2.6** per cent for women. These figures are partly "balanced" by a decrease in Hodgkin's lymphoma.

The calculations of the annual changes in trends and the graphs in **Figures F6** and **F7** show that the previous trends towards an increase in the incidence of cancer in the biliary passages and primary liver cancer (in both males and females) have been broken during the 1980s and early 1990s. This also applies for cancer of the ovary (**Figure F17**) and for cancers of pancreas (**Figure F9**), and lung (**Figure F2**) in males.

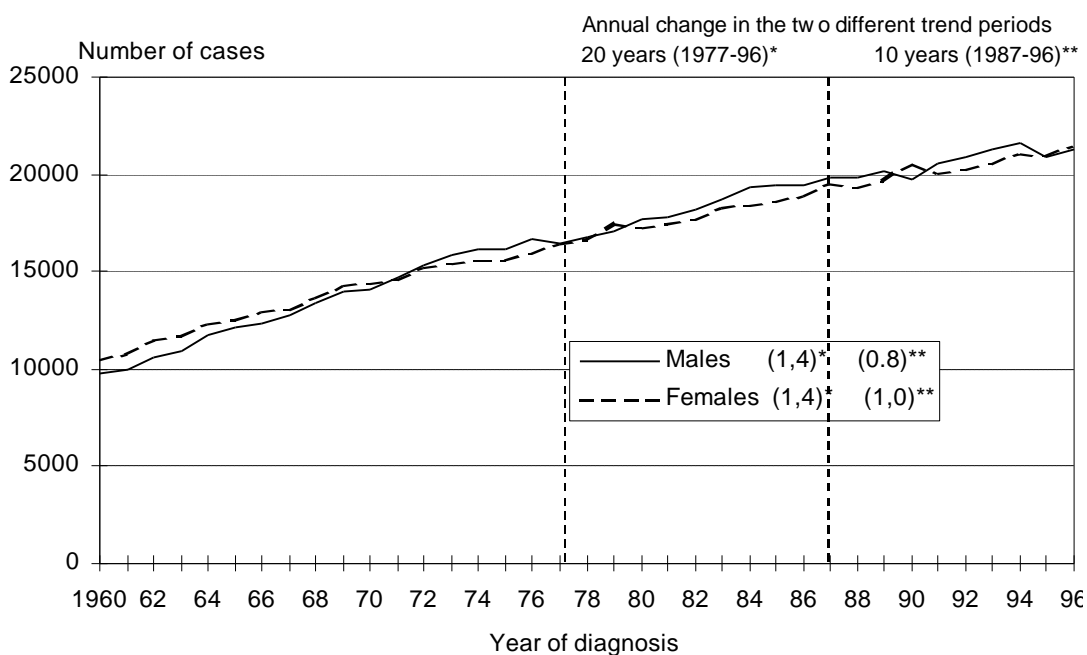

A decrease in trend is observed e. g. for Hodgkin's disease, cancer of lip in men, and for cancers of

- **cervix uteri.** The age standardized rate has decreased with **2.1** per cent a year for the 20-year period. This is evidently, in great measure, an effect of screening activities. The incidence may be levelling out at a rate of approximately 10 per 100 000.
- **stomach.** There is a remarkable decrease in incidence for both men and women during the whole period (**3.5** per cent for men and **3.7** per cent for women annually). Corresponding figures for the last 10-year period is **4.0** for both men and women.

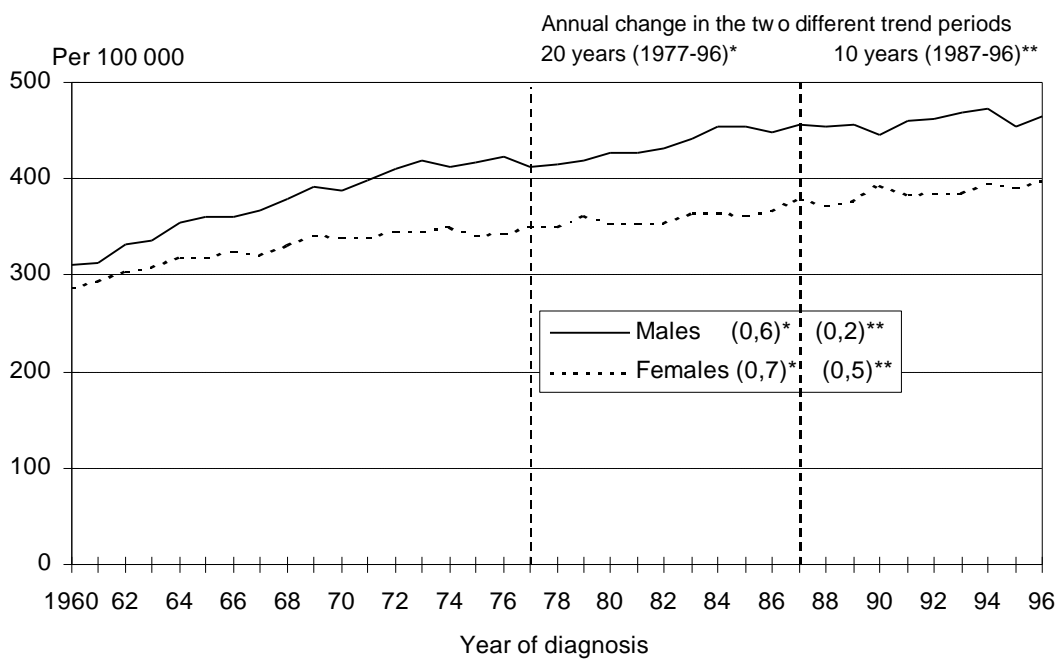

The rates in the incidence of cancer in various sites during the period **1960 - 1996** are plotted and presented in **Figures F1 - F27**. For many sites, the number of cases are few and random variations play an important role for the configuration of the graphs.

Please note that different scales are used among the figures. The rates are age standardized according to the population at the 1970 census.

## APPENDIX 1

### The major exceptions from the codes in the 7th WHO revision (WHO/HS/Canc/24.1. Code for anatomical location).

Site 158 (peritoneum) only includes malignant mesotheliomas of peritoneum, while metastatic lesions are referred to site 199.3.

Site 159 (unspecified digestive organs) has not been used. Such cases are included in site 199.

Site 162.2 (pleura) only includes malignant mesotheliomas.

Site 164 (mediastinum). Thymomas are referred to site 195.2.

Site 172 (corpus uteri) only includes malignant epithelial tumors of the mucosa.

Site 173 only includes malignant chorionic lesions (invasive mole and choriocarcinoma).

Site 174 (uterus, unspecified) includes carcinomas growing in both corpus and cervix uteri (or carcinoma uteri NOS), and uterine sarcomas.

Site 180.1 and 181 include papillomas of the urinary tract.

Site 191. Basaliomas are excluded.

Site 193.0 and .1 include histologically benign tumors of the central nervous system and meninges.

Site 193.3 includes malignant tumors of peripheral nerves and the sympathetic nervous system, irrespective of possible organ connection.

Site 195 (other endocrine glands) includes all benign and malignant tumors, though adrenocortical adenomas have been included only if they have given endocrinological symptoms.

Site 197 includes soft tissue sarcomas without organ connection, and also retroperitoneal tumors (197.4).

Site 198 (lymph nodes) has not been used. Metastatic tumors have been referred to site 199.

Site groups 206-207 have been replaced by groups 200-209 according to the Manual of the International Statistical Classification of Diseases, Injuries and Causes of Death (ICD-8). Thus, all malignant lymphomas have been coded here irrespective of possibly stated organ-location of the lesions. Consequently, only sarcomas of non-lymphomatous and non-neurogenic character are included in the various organ sites and site 197.

## APPENDIX 2

### Definitions of statistical terms

**Age** is defined as the date of diagnosis (year, month) minus the date of birth (year, month), the so-called exact age.

Those, in the age-group  $x$  to  $x+4$  years are born during some of the years  $t-5$ ,  $t-4$ ,  $t-3$ ,  $t-2$ ,  $t-1$  or  $t$ . Lexis diagram.

**The age-specific incidence rate**  $\frac{d}{n} m_x^t$  for the diagnosis  $d$  in the age-group  $x$  to  $x+n-1$  years during year  $t$  is given as

$$\frac{d}{n} m_x^t = \frac{\frac{d}{n} I_x^t}{\hat{L}_x^t} = \frac{\frac{d}{n} I_x^t}{\frac{n P_x^t + n P_x^{t+1}}{2}} \quad \text{where}$$

$\frac{d}{n} I_x^t$  is the number of new cancer cases for the diagnosis  $d$  in the age-group  $x$  to  $x+n-1$  years during year  $t$ ;

$\hat{L}_x^t = \frac{n P_x^t + n P_x^{t+1}}{2}$  is the mean population of Sweden in the age-group  $x$  to  $x+n-1$  years during year  $t$ ;

$n P_x^t$  is the population of Sweden at the beginning of year  $t$  in the age-group  $x$  to  $x+n-1$  years;

$n P_x^{t+1}$  is the population of Sweden in the same age-group at the beginning of year  $t+1$ .

$n$  is equal to 5 for all ages except for those older than 85 where it is an open interval ( $85+$  or  $85-\omega$ ).

**The crude incidence rate**  $\frac{d}{m} t$  for the diagnosis  $d$  and year  $t$  is given as

$$\frac{d}{m} t = \frac{\frac{d}{n} I_x^t}{\hat{L}_x^t} \quad \text{where}$$

$$\frac{d}{n} I_x^t = \sum_x^{\omega} \frac{d}{n} I_x^t ;$$

$$\hat{L}_x^t = \sum_x L_x$$

## APPENDIX 2

To be able to compare the cancer incidence in different years - and avoid the influence of differences in age distribution - direct standardization is used to

provide **the standardized incidence rate**  $d_m^{\wedge t}$ .

$$d_m^{\wedge t} = \sum_x^{\omega} W_{xn} d_{mx}^t \quad \text{where}$$

$\omega$  = maximum age

$W_{xn}$  is the percentage of the standard population for the age-group  $x$  to  $x+n-1$  years.

The standard populations used in this publication are given below.

Age standardized rates for the counties are calculated with weights from the Swedish 1970 census as standard population.

### Standard populations

Age	The Swedish 1970 census	The world population *
	%	%
0-4	6.9	12.0
5-9	7.1	10.0
10-14	6.6	9.0
15-19	6.8	9.0
20-24	8.1	8.0
25-29	7.8	8.0
30-34	6.1	6.0
35-39	5.5	6.0
40-44	5.8	6.0
45-49	6.5	6.0
50-54	6.5	5.0
55-59	6.3	4.0
60-64	5.9	4.0
65-69	5.0	3.0
70-74	3.9	2.0
75-79	2.7	1.0
80-84	1.5	0.5
85+	0.9	0.5
Total	100.0	100.0

\* Cancer Incidence in Five Continents, Volume IV, IARC, Lyon 1997.

The linear regression model is of the form  $Y = e^{a + b x}$  or equivalent to  $\ln Y = a + b x$ , where

$Y$  = estimated annual age standardized incidence rate per 100 000

$x$  = calendar year minus the midpoint of the period

$$a = \overline{\ln y} = \frac{\sum \ln y}{n}$$

$n$  = number of calendar years

$y$  = observed annual age standardized incidence rates.

$$b = \frac{\sum x (\ln y - \overline{\ln y})}{\sum x^2}$$

The variance of the regression coefficient  $b$  is

$$s_b^2 = \frac{s^2}{\sum x^2} \text{ where}$$

$s^2$ , the variance around the regression line, is defined by the formula

$$s^2 = \frac{\sum (\ln y - \overline{\ln y})^2 - b \sum x (\ln y - \overline{\ln y})}{n - 2}$$

The confidence interval  $b \pm 3 s_b$  is given in Table I and corresponds approximately to the 98 per cent level according to the Student's  $t$  distribution with  $n - 2$  degrees of freedom.

From the equation  $\ln Y = a + b x$  follows that  $Y = e^a \cdot e^{b x}$  where  $e^a$  represents the geometric mean of the annual standardized incidence rates and  $100 b$  corresponds to the average annual percentage change.

## CANCER REPORT

SOSFS 1984:32

(Tumors due to be reported, see overleaf)

Hospital, department

Patient's unique identification number (11 digits) with — century digit as first

C	Year	Month	Day	Birth code								

Name

Home address

County

Date of diagnosis\*

Year    Month    Day

Further information (if any)

### Diagnosis:\*\*

**State primary site and type of the tumor as specified as possible.** For paired organs, state side  Right  Left

When primary site is unknown state the location where the tumor was found.

### Basis of diagnosis:

1.  Clinical examination
2.  X-ray, scintigraphy, ultrasound, NMT, MR, DT  
(or other external (non-invasive) method)
3.  Biopsy or operation **with** HistoPathological Examination (HPE)
4.  Autopsy **with** HPE
5.  Cytological examination
6.  Operation **without** HPE
7.  Autopsy **without** HPE

Date of death

Year    Month    Day

Was the reported cancer incidentally found at autopsy  
( unsuspected, unknown before death)?

yes             No

Cytology / pathology department where diagnosis was made

Number and year of Cytology / pathology /autopsy report

Date                      Year    Month    Day

Signed

\* Date of the earliest examination where cancer was found.

\*\* If the patient has two or more primary tumors, use a separate form for each tumor.

Mail **Original** to  
the Regional Cancer Registry  
Address: see overleaf  
**Copy** is kept by the reporting agent

## 9 Coding according to ICD-O-2/ICD-10, and translation to earlier ICD versions

In general, coding of site has been done according to ICD-O-2. There are though a few exceptions where the ICD-10 codes have been applied. These sites are malignant melanoma of the skin, malignant lymphomas, and leukemias. An overview of the coding of site is given in **Table W1** as well as translations to other ICD versions. In **Table W2**, relevant morphology codes are included to properly identify malignant lymphomas, leukemias and related entities.

According to the rules for coding topography in the ICD-O-2 version, a tumor that "overlaps the boundaries of two or more subcategories and whose point of origin cannot be determined should be classified to subcategory 8". The experience gathered in the Swedish Cancer Registry over a long period of time tells that such a situation is extremely rare and, for practical purposes, not applicable in practical coding. On the other hand, certain tumors appearing multifocally within a defined site are not uncommon. For this reason, subcategory "8" has been reserved for these situations.

In the new system, the side of a pairy organ is coded separately, while earlier only breast was given a side code. The following sites or subsites are now given side codes: C34 (Bronchus and lung), C384 (Pleura, NOS), C50 (Breast), C570 (Fallopian tube), C571 (Broad ligament), C572 (Round ligament), C62 (Testis), C630 (Epididymis), C631 (Spermatic cord), C64 (Kidney), C65 (Renal pelvis), C66 (Ureter), C69 (Eye and adnexa), and C74 (Adrenal gland).

**Table W1. Translation of site codes from ICD-O-2/ICD-10 to ICD-7 and ICD-9**

**Table W1. Translation of site codes from ICD-O-2/ICD-10 to ICD-7 and ICD-9**

ICD-O-2/ ICD-10		ICD-7	ICD-9
C728	Multifocal tumor of brain and central nervous system	1938	1928
C729	Nervous system, NOS	1939	1929
C739	Thyroid gland	194	1939
C740	Cortex of adrenal gland	1950	1940
C741	Medulla of adrenal gland	1950	1940
C749	Adrenal gland, NOS	1950	1940
C750	Parathyroid gland	1951	1941
C751	Pituitary gland	1953	1943
C752	Craniopharyngeal duct	1930	1917
C753	Pineal gland	1930	1944
C754	Carotid body	1957	1945
C755	Aortic body and other paraganglia	1957	1946
C758	Multifocal tumor of endocrine glands	1958	1948
C759	Endocrine gland, NOS	1959	1949
C760	Head, face or neck, NOS	1991	1950
C761	Thorax, NOS	1992	1951
C762	Abdomen, NOS	1993	1952
C763	Pelvis, NOS	1994	1953
C764	Upper limb, NOS	1995	1954
C765	Lower limb, NOS	1995	1955
C767	Other ill-defined sites	1999	1959
C770	Lymph nodes of head, face and neck	1999	1960
C771	Intrathoracic lymph nodes	1999	1961
C772	Intra-abdominal lymph nodes	1999	1962
C773	Lymph nodes of axilla or arm	1999	1963
C774	Lymph nodes of inguinal region or leg	1999	1965
C775	Pelvic lymph nodes	1999	1966
C778	Lymph nodes of multiple regions	1999	1968
C779	Lymph node, NOS	1999	1969
C780	Secondary malignant neoplasm of lung	1999	1970
C781	Secondary malignant neoplasm of mediastinum	1999	1971
C782	Secondary malignant neoplasm of pleura	1999	1972
C783	Secondary malignant neoplasm of other and unspecified respiratory organs	1999	1973
C784	Secondary malignant neoplasm of small intestine	1999	1974
C785	Secondary malignant neoplasm of large intestine and rectum	1999	1975
C786	Secondary malignant neoplasm of retroperitoneum and peritoneum	1999	1976
C787	Secondary malignant neoplasm of liver	1999	1977
C788	Secondary malignant neoplasm of other and unspecified digestive organs	1999	1979
C790	Secondary malignant neoplasm of kidney and renal pelvis	1999	1980
C791	Secondary malignant neoplasm of bladder and other and unspecified urinary organs	1999	1981
C792	Secondary malignant neoplasm of skin	1999	1982
C793	Secondary malignant neoplasm of brain and cerebral meninges	1999	1983
C794	Secondary malignant neoplasm of other and unspecified parts of nervous system	1999	1984
C795	Secondary malignant neoplasm of bone and bone marrow	1999	1985
C796	Secondary malignant neoplasm of ovary	1999	1986
C797	Secondary malignant neoplasm of adrenal gland	1999	1989
C798	Secondary malignant neoplasm of other specified sites	1999	1989
C809	Unknown primary site	1999	1991
C809	Malignant neoplasm of multiple sites, NOS	1999	1990

**Table W2. Translation of site codes from ICD-O-2/ICD-10 to ICD-7 and ICD-9, including relevant morphology codes**

ICD-O-2/ ICD-10 snomed		C24	ICD-7	ICD-9
C810	96573 Hodgkin's disease, lymphocytic predominance	326	201	2019
